A revolution in GP care will create an environment in which people with musculoskeletal problems can get the best treatment closer to home. In April 2018, the NHS in England embarked on a fast-tracking overhaul of general practice in an effort to build resilience and capacity in the NHS GP network. Rising numbers of older people requiring care for the more complex musculoskeletal problems associated with older age have cornered the NHS into a tick-tock situation, where survival will depend on a robust network of GPs able to reduce demand on hospitals at the front door, by providing a less costly alternative service, and at the back door by enabling faster supervised discharge into patients’ homes.

For people with arthritis and other musculoskeletal (MSK) problems, this revolution in GP care is long overdue. The PCR Society aims to give GPs and primary care teams the tools and confidence to help their patients make informed choices about care. The only way the GP will work is if we use the most appropriate and skillful people for the job.
